

SunDog's League of Legends Performance Report

Analysis Period: July 24, 2025 - September 4, 2025
Total Matches Analyzed: 92 Games

Performance Highlights & Key Metrics

Metric	Value	Insight
Overall Win Rate	48.9%	You are very close to a positive win rate. A few small improvements can push you over 50%.
Most Played Champion	Sylas (36 games)	Sylas is your clear favorite, making up 39% of your played champions.
Highest Win Rate Champ (Min. 5 games)	Renekton (100% - 1 game), Aurora (80% - 5 games)	While Renekton is a small sample, your performance on Aurora is consistently excellent.

Highest Avg KDA Champ (Min. 5 games)	Sylas (TOP)	KDA: 13.0 (13/1/8). An incredible single-game performance, showing your high ceiling on this pick.
---	-------------	--

Overall Average KDA	~3.21	This is a solid score, indicating you contribute more to kills than you give to the enemy.
---------------------	-------	--

Overall Average CSPM	~5.54	This is a key area for improvement. Target 6.5-7.0+ CSPM for laners and 4.5-5.5+ for Jungle.
----------------------	-------	--

Overall Average DPM	~735	Your damage output is healthy for your elo. Focusing on farm will naturally increase this number.
---------------------	------	---

Detailed Champion Analysis

1. Sylas (Your Main)

- Games: 36
- Win Rate: 52.8%
- Avg KDA: 3.71
- Analysis: You have a positive win rate on Sylas, which is great for your most-played champion. Your KDA is strong, showing you know how to play him aggressively. However, there is significant volatility in your performance (some games with very high deaths). Consistency is key.

2. Standout Performers

- Aurora: 80% Win Rate (5 games). You have a very strong grasp of this champion. She is a potentially powerful pocket pick for you.
- Naafiri: 60% Win Rate (5 games). Another strong performer. You seem to excel on these more recent, skirmish-heavy champions.

3. Champions to Reconsider

- Caitlyn: 20% Win Rate (5 games). You are struggling to convert leads or survive on this immobile ADC.
 - Lee Sin: 25% Win Rate (4 games). Your performance in the jungle with Lee Sin has not been effective.
-

Role Performance Summary

- MIDDLE: Your most played role. Your performance is mixed but leans positive, largely carried by your Sylas and Aurora games.
- TOP: A volatile role for you. You have high-highs (13/1/8 Sylas) and low-lows. Decision-making on when to split-push vs. teamfight might be an issue.
- JUNGLE: Your weakest role. Your farm (CSPM) is very low for the jungle, indicating you may be falling behind in levels and gold by not efficiently clearing your camps.
- BOTTOM (ADC): A struggling role. Low win rates across multiple champions suggest a lack of comfort with ADC positioning and late-game teamfighting.
- UTILITY (Support): A small sample size, but your vision score is often good. Your win rate is held back by difficult games.

Actionable Insights & Where to Improve

1. PRIORITY: Improve Your Farming (CS per Minute)

This is your single biggest opportunity. At ~5.54 CSPM, you are leaving over 1,000 gold on the table every game compared to a player averaging 7.0 CSPM. This gold deficit puts you at a significant item disadvantage.

- How to improve: Focus on last-hitting in lane. Practice 10 minutes of custom games last-hitting only. Work on catching side waves in the mid-game.

2. Diversify Your Champion Pool & Role Focus

You play 36 games of Sylas but only have a 52.8% win rate. Meanwhile, you have an 80% win rate on Aurora over 5 games.

- How to improve: Consider making Aurora a primary pick when possible. Reduce the number of games on low-win-rate champions like Caitlyn and Lee Sin. Consider focusing on 2-3 roles instead of all five.

3. Limit Your "Hard Int" Games

The data shows several games with very high death counts (e.g., 1/12 Irelia, 0/9 Volibear). These games are almost unwinnable.

- How to improve: If you die twice in lane, your strategy must change. Stop fighting. Focus solely on safe farming under tower. Prioritize not giving the enemy laner any more kills. A 0/2 comeback is possible; a 0/8 comeback is not.

4. Jungle Pathing Efficiency

Your jungle CSPM is extremely low (e.g., 5 CS on Sylas JG at 22 minutes). This indicates poor camp sequencing and pathing.

- How to improve: Watch a basic jungle clear guide for your main jungle champions. Focus on full clearing when possible and tracking the enemy jungler to counter-gank or take their camps.

Conclusion: You are a capable player with clear strengths on specific champions like Sylas and Aurora. By focusing intensely on your farm (CSPM) and making more conscious decisions to avoid big losing streaks in lane, you will easily achieve a positive win rate and climb the ranked ladder. Good luck!
